

# OPERATING GLASS SKYLIGHT VCM (CURB MOUNT) INSTALLATION INSTRUCTIONS

CONDENSATION DRAINAGE IS PROVIDED ON ALL FOUR CORNERS

## Your Dayliter Skylight consists of:

- A - Factory assembled Skylight
- B - 2 Epoxy coated hinges (attached)
- C - Rubber seal under frame (installed)
- D - Lifter bracket & reinforcement bar (installed)
- E - Neoprene rain-proof skirt (installed)
- F - Operating mechanism (chain lifter)
- H - Bug screen (sold separately)
- I - Mechanism cover / screen rest

### STEP 1

Build a (2"x6") wood curb.

### STEP 2

Place and center skylight over curb, keeping the hinged on the high end of the roof.

### STEP 3

Install hinges onto curb with wood screws.

### STEP 4

Place mechanism cover / screen rest loosely on the other side of the hinges, on top of drywall and line up the pre-punched hole under bracket.

### STEP 5

Connect opening mechanism (lifter chain contracted) to Bracket on the skylight while going through rectangular hole on screen rest.

### STEP 6

Pull down on the lower end of skylight frame while aligning and fastening the mechanism to the wood curb going through the drywall with screws.

*\*this will assure that the rubber draft seal under skylight is in full contact with the top of the curb when skylight is shut.*

### STEP 7

Test opening mechanism to maximum heights and anchor mechanism cover / screen rest to wood curb as seen in the diagram.

### STEP 8

Now you can insert the bug screen diagonally through the opening and lower it down to rest on "J" bead of inside side finish. The fourth side should be on the mechanism cover / screen rest.

Your Dayliter operating skylight can be left open approximately 1" during rainy days for ventilation purposes.

If a bug screen is installed, during times of the year that the remains closed, it is advised that you remove the screen to Avoid excess heat building up between the screen and the skylight. Heat build up can blow the seal on the glass unit prematurely, and is not covered under the Dayliter Skylight warranty.
