SKYLIGHTS

INSULITE - THE ULTIMATE SKYLIGHT

This skylight was developed by Dayliter for harsh weather conditions, and has the highest insulating value of any skylight on the market today. (Approximately R5)

The skylight consists of a sealed unit in a PVC mainframe. The sealed unit can be enhanced with glazing options to be heat resistant (reflective), heat retaining (LoE₂), or both (LoE₂ and Heat Mirror). It can be triple glazed, clear or bronze.

In addition to the high performance glass unit, an acrylic dome is installed over the glass which adds insulation and sound-proofing, and makes the skylight suitable for either sloped or flat roof curb installation. The increased air space of the acrylic dome is a very effective buffer zone against heat, cold and noise. The dome, in conjunction with the sealed, double-glazed unit, makes the skylight triple-glazed; however it can also be made into quadruple glazing.

This unit can also be made to open and there are more than 20 standard sizes available, as well as flashing kits to complete your Insulite installation project.
